Abrégé

PURPOSE: To prepare the cutaneous agent for external application preventing the loss of physiologically active substances therein from the surface of skin due to sweat, sebum, washing, abrasion, etc., remaining at an applied site for a long time, and therefore not only good in percutaneous absorption but also good in the durability of the medicinal effects.

CONSTITUTION: This cutaneous agent is characterized by containing (A) a physiologically active substance and (B) one kind or more of the following copolymers (1) and (2). (1) A long chain alkyl (meth)acrylate which is the ester of a ≥ 8 C alcohol with (meth)acrylic acid and (2) a (meth) acrylate having a ≥ 4 C perfluoroalkyl or polyfluoroalkyl group. Since having a high water-clogging effect, this cutaneous agent is especially useful for the therapy of dermatitides particularly exhibiting xerosis syndromes.
